

Restaurant Demo Generator System

Overview

We are building a restaurant-focused demo generation platform for Blackpool Industry.

The goal is NOT to build custom websites manually for every restaurant.

The goal is to build ONE reusable Next.js application that can instantly generate branded restaurant demo pages from structured data.

This system will be used internally by Blackpool Industry to:

- Create restaurant demos in minutes
- Generate outreach-ready preview links
- Show restaurant owners how a better ordering and conversion system could look
- Scale outreach without rebuilding websites repeatedly

This is a lead generation and conversion system first.

Not a generic website builder.

Core Business Problem

Many restaurants in Kenya:

- rely only on Instagram/Facebook/WhatsApp
- have no website
- use image menus or PDFs
- force customers to DM or call manually
- lose customers because ordering is inconvenient
- have poor Google search conversion

The platform exists to solve this problem.

The demos should help restaurant owners immediately understand:

"This could help us get more orders."

Core Product Philosophy

IMPORTANT

We are NOT building:

- a full food delivery platform
- an Uber Eats clone
- a restaurant POS
- a complex SaaS
- a multi-tenant ecommerce system

We ARE building:

- a fast demo generation system
- a reusable restaurant landing page engine
- a sales tool for outreach
- a scalable client acquisition system

The system must prioritize:

- speed
- simplicity
- reusability
- fast deployment
- low friction

High-Level Architecture

The application consists of:

1. Next.js frontend application
2. Admin dashboard
3. Supabase database
4. Supabase Storage for images
5. Dynamic demo routes
6. Demo generation APIs
7. Vercel hosting

Architecture:

Admin Dashboard

↓

Create Restaurant Demo

↓
Save Restaurant Data
↓
Generate Dynamic Demo Route
↓
Publish Demo
↓
Share Link With Client

Tech Stack

Frontend

- Next.js App Router
- TypeScript
- Tailwind CSS
- React Server Components where useful

Backend

- Next.js Route Handlers
- Supabase

Hosting

- Vercel

Storage

- Supabase Storage

Authentication

- Supabase Auth

Core System Concept

ONE APP

We will host ONE application.

We will NOT create:

- one repo per client
- one deployment per client
- one codebase per restaurant

The entire system is data-driven.

Restaurant data changes.

The template stays the same.

Dynamic Demo System

All demos will use dynamic routes.

Example:

```
/demo/[slug]
```

Examples:

```
/demo/urban-bites-westlands  
/demo/kilimani-grill  
/demo/savannah-cafe
```

The route reads restaurant data from the database and injects it into the reusable restaurant template.

Admin Dashboard

The system requires a private admin dashboard.

Routes:

```
/admin  
/admin/demos  
/admin/demos/new  
/admin/demos/[id]/edit
```

The admin dashboard is used internally by Blackpool Industry.

Restaurant owners do NOT access the dashboard.

Demo Creation Flow

Step 1

User logs into admin dashboard.

Step 2

User clicks:

Create New Demo

Step 3

User fills in restaurant information.

Required fields:

- Restaurant name
- Area/city
- Phone number
- WhatsApp number
- Google Maps URL
- Instagram URL
- Facebook URL (optional)
- Menu items
- Food images

Step 4

User clicks:

Generate Demo

Step 5

System:

- creates slug
- stores data
- uploads images
- generates demo
- returns preview URL

Step 6

User previews demo.

Step 7

User publishes demo.

Step 8

User sends demo link to restaurant owner.

Restaurant Demo Template

The template must be reusable.

The system should NEVER require redesigning pages manually.

Sections:

1. Hero Section

Contains:

- restaurant name
- hero image
- tagline
- WhatsApp CTA
- order button

2. Featured Menu

Displays:

- menu cards
- item images
- descriptions
- prices (optional)

3. Why Choose Us

Simple trust/value section.

Examples:

- Fast ordering
- Fresh meals
- Easy delivery
- Convenient location

4. Gallery

Food photos.

5. Contact Section

Contains:

- WhatsApp button
- phone number
- location
- Google Maps link

6. Footer

Simple branding/footer.

Design Philosophy

The demos should:

- look modern
- look mobile-first
- feel fast

- feel premium
- be simple to navigate
- focus on conversion

The demos should NOT:

- feel overloaded
- contain unnecessary animations
- include complicated ecommerce systems
- include user accounts
- include fake advanced functionality

Primary goal:

Make restaurant owners immediately visualize improved customer conversion.

Database Design

Main Table

restaurant_demos

Stores:

- business name
- slug
- contact info
- social links
- hero text
- branding colors
- publish state

Menu Table

restaurant_menu_items

Stores:

- menu items
- descriptions
- prices
- images
- ordering

Gallery Table

```
restaurant_gallery_images
```

Stores:

- image URLs
 - sort order
 - alt text
-

Slug System

Every demo must generate a clean slug.

Example:

```
Urban Bites + Westlands  
→ urban-bites-westlands
```

The slug must:

- be lowercase
 - be URL safe
 - be unique
 - avoid duplicates
-

Demo States

Each demo should support states.

Draft

Internal only.

Published

Publicly accessible.

The system should support:

- publishing
 - unpublishing
 - editing
 - previewing
-

Hosting Flow

The app is deployed ONE time on Vercel.

Example:

```
blackpool-demo-system.vercel.app
```

Once hosted:

- all demos are generated dynamically
- new demos do NOT require redeployment
- new demos only require database inserts

Example public URL:

```
blackpool-demo-system.vercel.app/demo/urban-bites-westlands
```

Image Storage

Images should NOT be stored directly inside the project.

Use Supabase Storage.

Flow:

```
Upload Image  
→ Store In Supabase Storage  
→ Save Public URL In Database  
→ Render Image In Demo
```

Future AI Features

The system should be architected so AI features can be added later.

Examples:

AI Tagline Generation

Generate restaurant hero text automatically.

AI Menu Descriptions

Generate descriptions for menu items.

AI Lead Scoring

Evaluate quality of restaurant leads.

AI Demo Autofill

Paste:

- restaurant name
- Maps URL
- Instagram URL

Then auto-generate:

- hero copy
- menu placeholders
- trust sections
- branding defaults

Outreach Use Case

The generated demos are used during outreach.

Typical flow:

1. Find restaurant lead
2. Create quick demo
3. Send preview link

4. Start sales conversation
5. Convert restaurant into paying client

The demo itself is a sales tool.

Performance Requirements

The platform must prioritize speed.

Demo Creation Speed

Target:

5-15 minutes per demo

Page Speed

Pages should:

- load quickly
 - be mobile optimized
 - use optimized images
 - avoid heavy JS
-

Security Requirements

Admin Dashboard

Must be protected.

Only Blackpool Industry staff can access admin pages.

Public Demos

Published demos are public.

Draft demos remain private.

Development Rules

IMPORTANT

Always optimize for:

- reuse
- scalability
- speed of demo creation
- maintainability

Avoid:

- overengineering
- unnecessary abstraction
- excessive animations
- complicated business logic
- feature bloat

This platform is a demo generation engine.

Not a massive SaaS.

Primary Goal

The primary goal of this system is:

Generate convincing restaurant demos fast enough to scale outreach and close clients.

Everything should support that goal.

If a feature slows demo creation significantly without increasing conversion value, it should probably NOT be added.
